Column descriptions for data provided in PLOS-Dataset_v10_Jul25.csv and Comparator-Dataset_v10_Jul25.csv and later versions until superseded by a new column descriptions version. The Method column indicates how data is gathered, whether from XML file data, OpenAlex or found by DataSeer's assessment.

Column Name	Column description	Method	Additional Notes
Publication_Day	Day of publication for each article	XML	"epub" date is used
Publication_Month	Month of publication for each article	XML	"epub" date is used
Publication_Year	Year of publication for each article	XML	"epub" date is used

DOI	Digital object identifier (DOI) for each article	XML	
Primary_Topic_Field	High level subject classification for each article	OpenAlex	OpenAlex schema lists 26 possible categories for field
Primary_Topic_Subfield	Granular subject classification for each article	OpenAlex	OpenAlex schema lists 252 possible categories for subfield
Discipline	Disciplinary information taken from the Major MeSH terms for each article	XML	Present for Comparator dataset only
Corresponding_Author_Country	Country of the listed affiliation of the first listed corresponding author	OpenAlex	If multiple affiliations are listed the first one is used. If multiple corresponding authors are listed, the first listed corresponding author is used.
First_Author_Country	Country of the first author (from all listed authors)	OpenAlex	If multiple affiliations are listed the first one is used.
DA_data	The article's data availability statement	XML	For the Comparator data it comprises any Availability type statements (e.g. Data Availability or Code Availability) found in the article. If multiple statements are found they are separated by the " " character.
Data_Section_Text_Generated	Which sections of the research article indicated data was generated when assessed by DataSeer algorithm.	DataSeer	Labeled NA if no data/code generation detected. If XML section tags are not available this will be labeled "Full Text"
Data_Generated	Was data generated in this text as assessed by DataSeer algorithm.	DataSeer	Labeled "TRUE" or "FALSE"
Data_Shared	Was data shared in this text as assessed by DataSeer algorithm.	DataSeer	Labeled "TRUE" or "FALSE"

Data_Location	Location of data that was indicated as shared.	DataSeer	Labeled “Online” when a repository was used. Multiple sections are comma separated (e.g. Online,Supplementary Information)
Repositories_data	A list of standard repositories that were identified by DataSeer as having been used in the sharing of data/code in each article. Repositories are identified from URL/DOI/Accession IDs where possible. Only repositories from a standardized list will be identified. Domains will be provided for unidentified URLs where possible.	DataSeer	Multiple repositories are comma separated (e.g. Github, Dryad)
URL_data	A list of any URLs provided that host data or code online that were detected by DataSeer algorithm.	DataSeer	Multiple URLs are comma separated
Accessions	A list of Accession IDs from identified repositories that host data or code online that were detected by DataSeer algorithm.	DataSeer	Multiple Accession IDs are comma separated
Data_DOIs	A list of DOIs provided that host data or code online that were detected by DataSeer algorithm.	DataSeer	Multiple DOIs are comma separated
Preprint_Match	Whether a preprint was identified for this published article when searching common DOI registration agencies.	DataSeer	“TRUE” or “FALSE” indicating whether a match was found across DOI registration agencies.
Preprint_DOI	DOI of identified preprint match.	Preprint Metadata	Gathered from DOI agency metadata.
Preprint_Day	Day of preprint DOI registration,	Preprint	Note: Datacite DOI metadata does not always include a detailed date

	usually same date as publication.	Metadata	(will sometimes only include year level).
Preprint_Month	Month of preprint DOI registration, usually same date as publication.	Preprint Metadata	Note: Datacite DOI metadata does not always include a detailed date (will sometimes only include year level).
Preprint_Year	Year of preprint DOI registration, usually same date as publication.	Preprint Metadata	Note: Datacite DOI metadata does not always include a detailed date (will sometimes only include year level).
Preprint_URL	URL to access top preprint match.	Preprint Metadata	Provided where available, dependent on metadata.
Preprint_Server	Server top preprint match is hosted on.	Preprint Metadata	If server name is not provided in preprint metadata DOI prefix is used to identify server when possible.
Code_Section_Text_Generated	Which sections of the research article indicated code was generated when assessed by DataSeer algorithm.	DataSeer	Labeled NA if no code generation detected. Multiple sections are comma separated (e.g. Methods,Supplementary Information) If XML section tags are not available this will be labeled "Full Text"
Code_Generated	Was code generated in this text as assessed by DataSeer algorithm.	DataSeer	Labeled "TRUE" or "FALSE"
Code_Shared	Was code shared in this text as assessed by DataSeer algorithm.	DataSeer	Labeled "TRUE" or "FALSE" Note: Shared <i>code is only detected if it is executable</i> (e.g. shared as a .R or .py file format), code shared in pdf of other image formats is not labeled as shared.
Code_Location	Location of code that was indicated as shared.	DataSeer	Labeled "Online" when a repository was used.
Protocol_Shared	Was a protocol shared in this text as assessed by DataSeer algorithm	DataSeer	Labeled "TRUE" or "FALSE"
n_protocols	Number of distinct protocols shared as assessed by DataSeer	DataSeer	
Protocol_Location	Location of protocol(s) detected.	DataSeer	Location of each protocol is listed as either "Collection", "Repository", "Journal" or "Supplemental Information". For articles with multiple

			protocols, the locations are presented as a comma separated list
Protocol_Source	Name of protocol location if it falls into the “Publication” or “Repository” category.	DataSeer	For articles with multiple protocols, the sources are presented as a comma separated list
Protocol_URL	URL of identified protocols	DataSeer	For articles with multiple protocols, the URLs are presented as a comma separated list
has_common_authors	Common authors are defined as name matches using author names as listed in the OpenAlex entry for the article and from the protocol source. A match is labelled as TRUE if all authors are in common in both outputs regardless of authorship position.	DataSeer	Labelled “TRUE” or “FALSE” for each protocol identified. For articles with multiple protocols, the match results are presented as a comma separated boolean list corresponding to the list of protocols, .e.g “TRUE, TRUE”
Registration_Shared	Was one or more study registrations shared in this article, as assessed by DataSeer?	DataSeer	Options are “TRUE” or “FALSE”
Registries	Which registry/ies were used for the detected study registrations?	DataSeer	Options are limited to the 31 registries that appear in Registry-List_Jun24.csv. If more than one registry was used this is presented as a comma separated list
Registration	Unique identifier assigned to the detected registration by the registry	DataSeer	If more than one registration was detected the registration identifiers are presented as a comma separated list
Registration_Number	Number of registrations detected in the article	DataSeer	
Mentions_Number	Number of times the registration was mentioned or cited in the article	DataSeer	For articles with multiple registrations this is the sum of all the mentions
Registration_Detected_As	In what format was the information about the study registration	DataSeer	Options are “text” or “link”. If multiple formats are detected this is presented as a comma separated list

	presented?		
Registration_Section_Reported	Which sections of the article indicated that a study registration was shared, as assessed by DataSeer?	DataSeer	If registrations are detected in more than one section this is presented as a semi-colon separated list
Quarter	Quarter of publication inferred from Publication_Month and Publication_Year	DataSeer	Format is “Year Quarter”, e.g. “2020 Q1” or “2018 Q4”
